"Today's Trading Signals" is prepared by Financial Trend Analysis (FTA). Decision-making is subjective but based on a number of technical analysis models. Exchange rate information comes from Bloomberg or Reuters and the return is calculated daily based on prices from these suppliers. Since there are no actual trades behind the return in securities covered in the analysis the return is theoretical. No back testing has taken place.

Past performance is no guarantee of future results and the actual current performance of the portfolio may be lower or higher than the theoretical performance of the strategies. Theoretical strategy returns were the result of certain market factors and events which may not be replicated in the future.

**Performance calculations** are exclusive of carry. The Information Ratio is based on monthly data and measured from 1 January 2007.

Return is protected by a number of stop orders that are not apparent in the daily table, but which can be shared with customers who subscribes for the publication. The return assumes that there is the same nominal exposure in each currency cross.

**Slippage** is calculated at between 2 and 10 ticks for "Majors" and "Cross Rates", between 10 and 30 for "Nordic" and between 10 and 50 ticks for "Emerging markets". The trading system includes a number of details that do not appear in the daily table.

The **Information ratio** (IR)<sub>m</sub> is a measure of the risk-adjusted return of a financial security (or asset or portfolio). It is defined as expected active return divided by tracking error, where active return is the difference between the return of the security and the return of a selected benchmark index, and tracking error is the standard deviation of the active return; i.e., the information ratio *I* is:

$$I = \frac{E[R - R_b]}{\sigma} = \frac{E[R - R_b]}{\sqrt{\text{var}[R - R_b]}}$$

where *R* is the portfolio return, *R<sub>b</sub>* is the benchmark return, *E*[*R - R<sub>b</sub>*] is the expected value of the active return, and *σ* is the standard deviation of the active return. The information ratio is often used to gauge the skill of managers of mutual funds, hedge funds, etc. In this case, it measures the expected active return of the manager's portfolio divided by the amount of risk that the manager takes relative to the benchmark. The higher the information ratio, the higher the active return of the portfolio, given the amount of risk taken, and the better the manager. Top-quartile investment managers typically achieve information ratios of about one-half.

Generally, the ratio compares annualized returns of the manager's portfolio with those of benchmarks such as the yield on three-month Treasury Bills or an equity index such as the S&P 500. Since this ratio considers the annualized standard deviation of both series (as measures of risks inherent in owning either the portfolio or the benchmark), the ratio shows the risk-adjusted active return of the portfolio over the benchmark.

#### Financial models and/or methodology used in this report

Technical analysis is a method of evaluating securities by analyzing statistics generated by market activity, past prices, and volumes. Technical analysts look for patterns and indicators on charts that could determine future performance. Various technical analysis models are used to evaluate the market.

#### RISK WARNING

**THE PERFORMANCE IS HYPOTHETICAL. PAST PERFORMANCE IS NO GUARANTEE FOR FUTURE PERFORMANCE. THE ESTIMATE OF THE FUTURE PERFORMANCE OF (FINANCIAL) INSTRUMENTS IN THE REPORT "TRADING SIGNALS" PREPARED BY FTA MAY DEVIATE FROM THE ACTUAL PERFORMANCE OF THE INSTRUMENTS. HYPOTHETICAL OR SIMULATED PERFORMANCE RESULTS HAVE CERTAIN INHERENT LIMITATIONS. UNLIKE AN ACTUAL PERFORMANCE RECORD, SIMULATED RESULTS DO NOT REPRESENT ACTUAL TRADING. IN ADDITION, SINCE SOME OR ALL TRADES HAVE NOT ACTUALLY BEEN EXECUTED, THE RESULTS MAY HAVE UNDER-OR-OVER COMPENSATED FOR THE IMPACT, IF ANY, OF CERTAIN MARKET FACTORS, SUCH AS LACK OF LIQUIDITY OR FAST MARKET CONDITIONS. NO REPRESENTATION IS BEING MADE THAT ANY ACCOUNT WILL OR IS LIKELY TO ACHIEVE PROFITS OR LOSSES SIMILAR TO THOSE SHOWN. IN FACT, THERE ARE FREQUENTLY SHARP DIFFERENCES BETWEEN HYPOTHETICAL PERFORMANCE RESULTS AND THE ACTUAL RESULTS SUBSEQUENTLY ACHIEVED BY ANY PARTICULAR TRADING PROGRAM.**

**ONE OF THE LIMITATIONS OF HYPOTHETICAL PERFORMANCE RESULTS IS THAT THEY ARE GENERALLY PREPARED WITH THE BENEFIT OF HINDSIGHT. IN ADDITION, HYPOTHETICAL TRADING DOES NOT INVOLVE FINANCIAL RISK, AND NO HYPOTHETICAL TRADING RECORD CAN COMPLETELY ACCOUNT FOR THE IMPACT OF FINANCIAL RISK IN ACTUAL TRADING. FOR EXAMPLE, THE ABILITY TO WITHSTAND LOSSES (AND INCUR ACCOUNT DRAW DOWNS) OR TO ADHERE TO A PARTICULAR TRADING PROGRAM IN SPITE OF TRADING LOSSES ARE IMPORTANT ISSUES WHICH CAN ALSO ADVERSELY AFFECT ACTUAL TRADING RESULTS. THERE ARE NUMEROUS OTHER FACTORS RELATED TO THE MARKETS IN GENERAL OR TO THE IMPLEMENTATION OF ANY SPECIFIC TRADING PROGRAM WHICH CANNOT BE FULLY ACCOUNTED FOR IN THE PREPARATION OF HYPOTHETICAL PERFORMANCE RESULTS AND ALL OF WHICH CAN ADVERSELY AFFECT ACTUAL TRADING RESULTS.**

**ONLY RISK CAPITAL SHOULD BE USED FOR FOREX, COMMODITIES, FUTURES AND OTHER FINANCIAL INSTRUMENTS TRADING DUE TO THE HIGH RISK OF LOSS.**
